Number of clinical trials to use wearables nears 300

September 16, 2015 | By Nick Paul Taylor

In recent years, the use of wearables in clinical trials has gone from being an attractive but untested idea to an emerging part of the research toolkit. Now, Bloomberg has tallied up just how many trials are building the devices into their protocols: 299.

Medicines Adaptive Pathways to Patients MAPPs

- prospectively planned, adaptive approach to bringing drugs to market
- starting from an authorised (eventually "niche") indication
- iterative phases of evidence gathering and progressive licensing adaptations
- balancing timely access for patients with the need to provide adequate evolving information on benefits and harms.

Transition from...

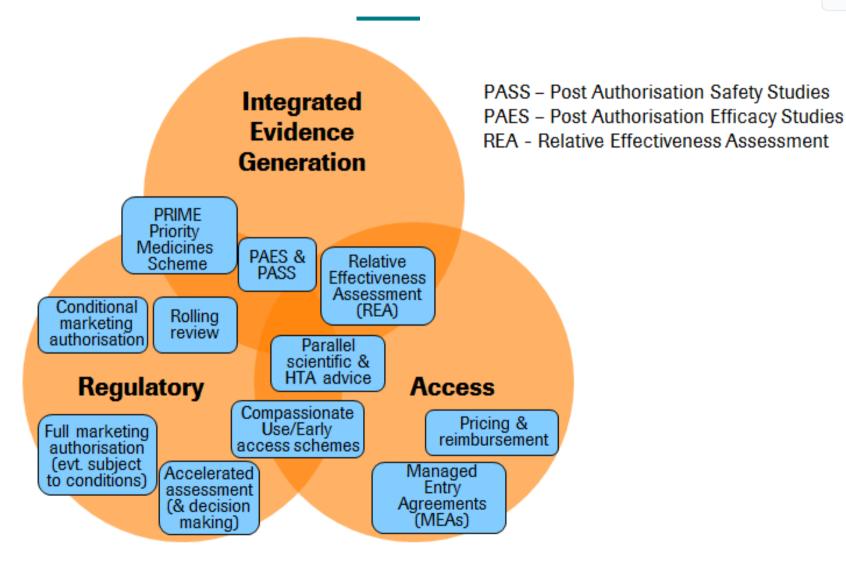

- Magic moment
- Prediction
- RCT only
- Big populations
- Focus on licensing
- Regulators/industry
- Open utilisation

To...

- Life-span management
- Monitoring
- Toolkit for evidence generation
- Small populations
- Focus on patient access
- Regulators, patients, industry, HTA bodies, payers
- Managed utilisation
